

ABSTRACT OF THE DISCLOSURE

A flexible carrier (10) having a base layer made of plastic and at least one conducting structure (20) which is impressed at least on the base layer (12) with an electrically conductive paint on one side thereof. The at least one electrically conducting layer (20) is arranged between the base layer (12), and at least one covering layer (14) made of plastic and each of the optionally other electrically conducting structures (22) are respectively arranged between two successive other covering layers. The base layer (12) is connected to the at least one covering layer (14) and each of the optionally other covering layers is connected to the adjacent covering layers.
